

1. React is an open-source JavaScript library used to build interactive user interfaces. It uses reusable components to create modern web applications.
2. React is primarily a JavaScript library for building user interfaces. For complete applications, it can be combined with other libraries and tools.
3. A component is a reusable piece of UI written commonly as a JavaScript function. It returns JSX that describes what should appear on the screen.
4. Components divide a large application into smaller, manageable parts. They improve reusability, readability, maintainability, and organization.
5. JSX is a syntax extension that allows HTML-like markup to be written inside JavaScript. It makes writing and describing React UI easier and more readable.
6. Virtual DOM is a common term for React's in-memory representation of the UI. React uses it during rendering and reconciliation to determine necessary DOM updates.
7. Real DOM is the actual Document Object Model maintained by the browser. It is the HTML displayed and updated in webpages.
8. Reconciliation is the process React uses to determine changes between the previous and new UI trees. React then commits necessary changes to the Real DOM.
